

Pranav Narasimhan

Product Enthusiast

pranav.n2535@gmail.com | +91-7660874948 | LinkedIn | Portfolio

Product management enthusiast currently building products in the HRMS space at Darwinbox. Led Spotlight, an in-house replacement for Pendo, launched AI agents across 15+ clients, and built API-driven automation that cut ticket assignment time by 80%. Drawn to AI-enabled products that solve real user problems, with an engineering background and a metrics-first approach to every decision.

EDUCATION

Birla Institute of Technology and Science, Pilani Oct 2022 – July 2026
B.E. (Hons.) in Electrical & Electronics Engineering, GPA: 8.02/10

WORK EXPERIENCE

Product Analyst – AI & Studio June 2026 – Present
Darwinbox Digital Solutions

Owens internal product initiatives and AI-enabled workflow improvements across platform and operations use cases.

- Led 0 to 1 development of Spotlight, an internal replacement for Pendo used by 3 product teams, guiding a 7-person cross-functional team from problem definition to launch in 2 months, achieving feature parity and eliminating about \$100K/year in third-party licensing costs.
- Translated ambiguous stakeholder needs into product requirements, execution plans, and launch scope for an internal analytics product, supporting faster product decisions with [result: adoption rate, decision cycle time, or feature shipped].
- Partnered across product, engineering, and operations to test workflows, refine feature behavior, and iterate quickly based on internal user requirements and adoption feedback.

Product Management Intern – AI & Studio Jan 2026 – June 2026
Darwinbox Digital Solutions

Built automation, integration, and AI solutions that improved workflow efficiency, data accuracy, and internal knowledge access.

- Built an automated ticket allocation engine using Jira APIs and Darwinbox Automation Hub to route 150+ tickets across module-specific queues for 15 users, cutting assignment time by 80% and creating a reusable workflow model.
- Built a real-time webhook ingestion pipeline to push verified third-party background verification data into employee profiles, reducing manual re-entry to zero across 3 workflows and improving data consistency.
- Launched AI agents for knowledge management, GTM support, and internal query resolution across 8+ industries and 15+ clients, reclaiming an estimated 3 operational hours through faster issue resolution and self-serve access.
- Extended the AI system into a Slack-integrated superagent with a Claude-powered context graph, improving internal access to technical information and enabling faster cross-functional support.
- Prepared and presented technical solution flows, product logic, and rollout plans to internal stakeholders, aligning engineering and business teams on requirements and implementation priorities.

PROJECTS

FoodSwift: Fulfillment Reliability and Retention Optimization Dec 2025
Product Strategy – Academic Portfolio

Marketplace product strategy project focused on diagnosing declining retention and improving fulfillment trust through product interventions and metrics design.

- Analyzed declining Orders per Month from 3.2 to 2.8 and NPS from 42 to 35 (case-study data), identifying post-confirmation cancellations as the main driver of silent churn through structured root cause analysis.
- Designed a reliability-first product strategy with wireframes and an executive-ready presentation, translating user and business insights into launchable interventions to improve retention.
- Defined primary, supporting, and guardrail metrics including Orders per Month, NPS, Cancellation Rate, Repeat Order Rate, and AOV to guide product testing and iteration.

Trippy: Decision Intelligence Platform for Travel Planning Nov 2025
Product Analytics – Academic Portfolio

Decision science and product concept project addressing choice overload in travel planning with recommendation and experimentation frameworks.

- Conducted persona-based segmentation to identify traveler archetypes and user pain points across decision fatigue, group conflict, and booking drop-off.
- Designed a recommendation engine concept using curated choice architecture and group preference alignment to improve decision speed and booking confidence.
- Built experimentation frameworks for onboarding, engagement, and conversion to test product hypotheses and guide iteration.

Findster: Campus Lost and Found App July 2025
Product Design – Academic Portfolio

Campus product concept validated through user research and prototyping to improve item recovery and user trust.

- Prototyped a lost and found app with photo-based search, categories, and real-time alerts, validating demand through 30+ surveys and 8 interviews.
- Presented a product roadmap with map-based tracking, resale of unclaimed items, and campus onboarding to show scalability and adoption potential.

SKILLS

Product Management: Product Strategy, Product Development, Feature Prioritization, User Requirements, Market Analysis, Go-to-Market Support, PRDs, Technical Specifications, Agile, Scrum, Experimentation, Metrics Frameworks

Programming and Technical: Python, SQL, REST APIs, Webhooks, Jira APIs, PostgreSQL, ETL Pipelines, Event-Driven Workflows, Automation

AI/ML and Data Analysis: AI Agents, Generative AI, Machine Learning, Funnel Analysis, Business Analytics, Power BI, Excel, Decision Intelligence

Cross-Functional Execution: Engineering, UX, Stakeholder Management, Technical Presentations, Business Case Modeling
